

Evaluation of EU-DEM over the Eastern Mecsek Mountains – assessing its applicability for landform classification using the geomorphons approach

*Edina Józsa, Geographer MSc II. – Péter Kalmár, Geographer MSc I.
Supervisor: Dr. Szabolcs Ákos Fábián, PTE TTK GI*

*Forum of Young Geoinformaticians
Zvolen, 6. June 2014*

Introduction & Aims

A freely available DEM...

- requirements: accurate, free, unified structure, actual elevation model

...it's evaluation...

- general and area specific errors
- knowing the geographical conditions – opportunity to correct

...and geomorphic applicability

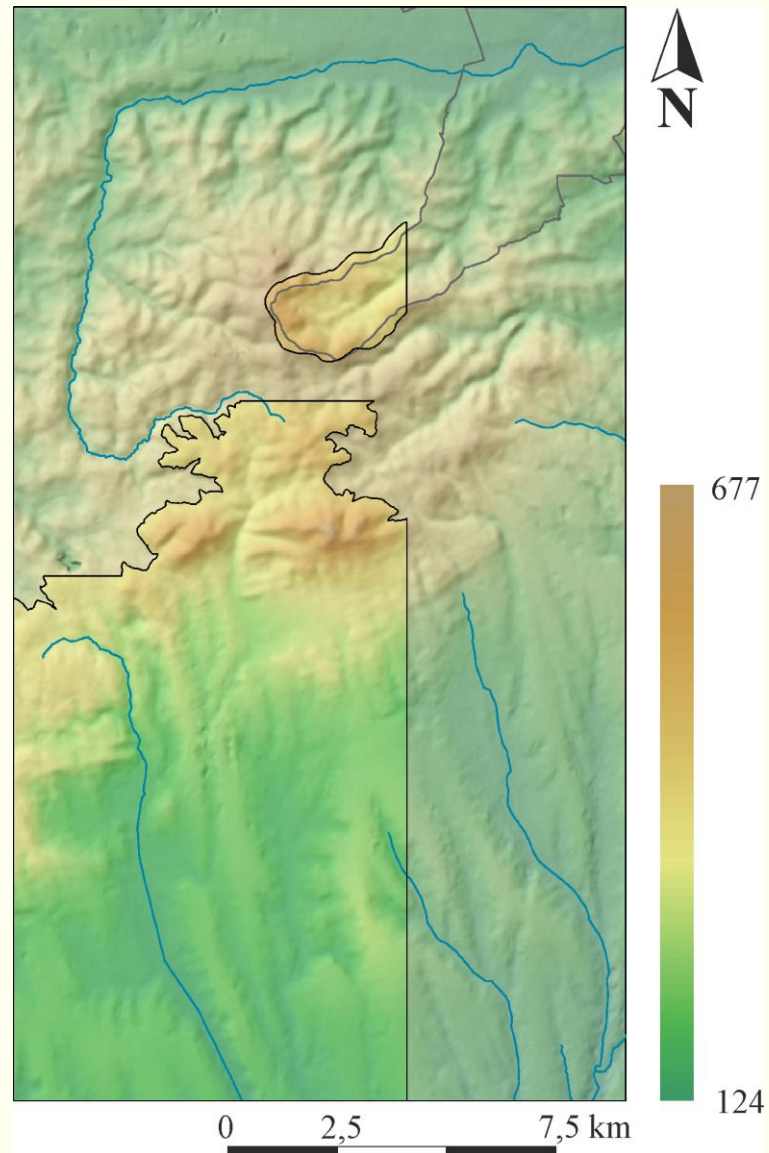

- use of DEMs in geomorphology
- possibility of numeric comparison of the literature and the „reality”

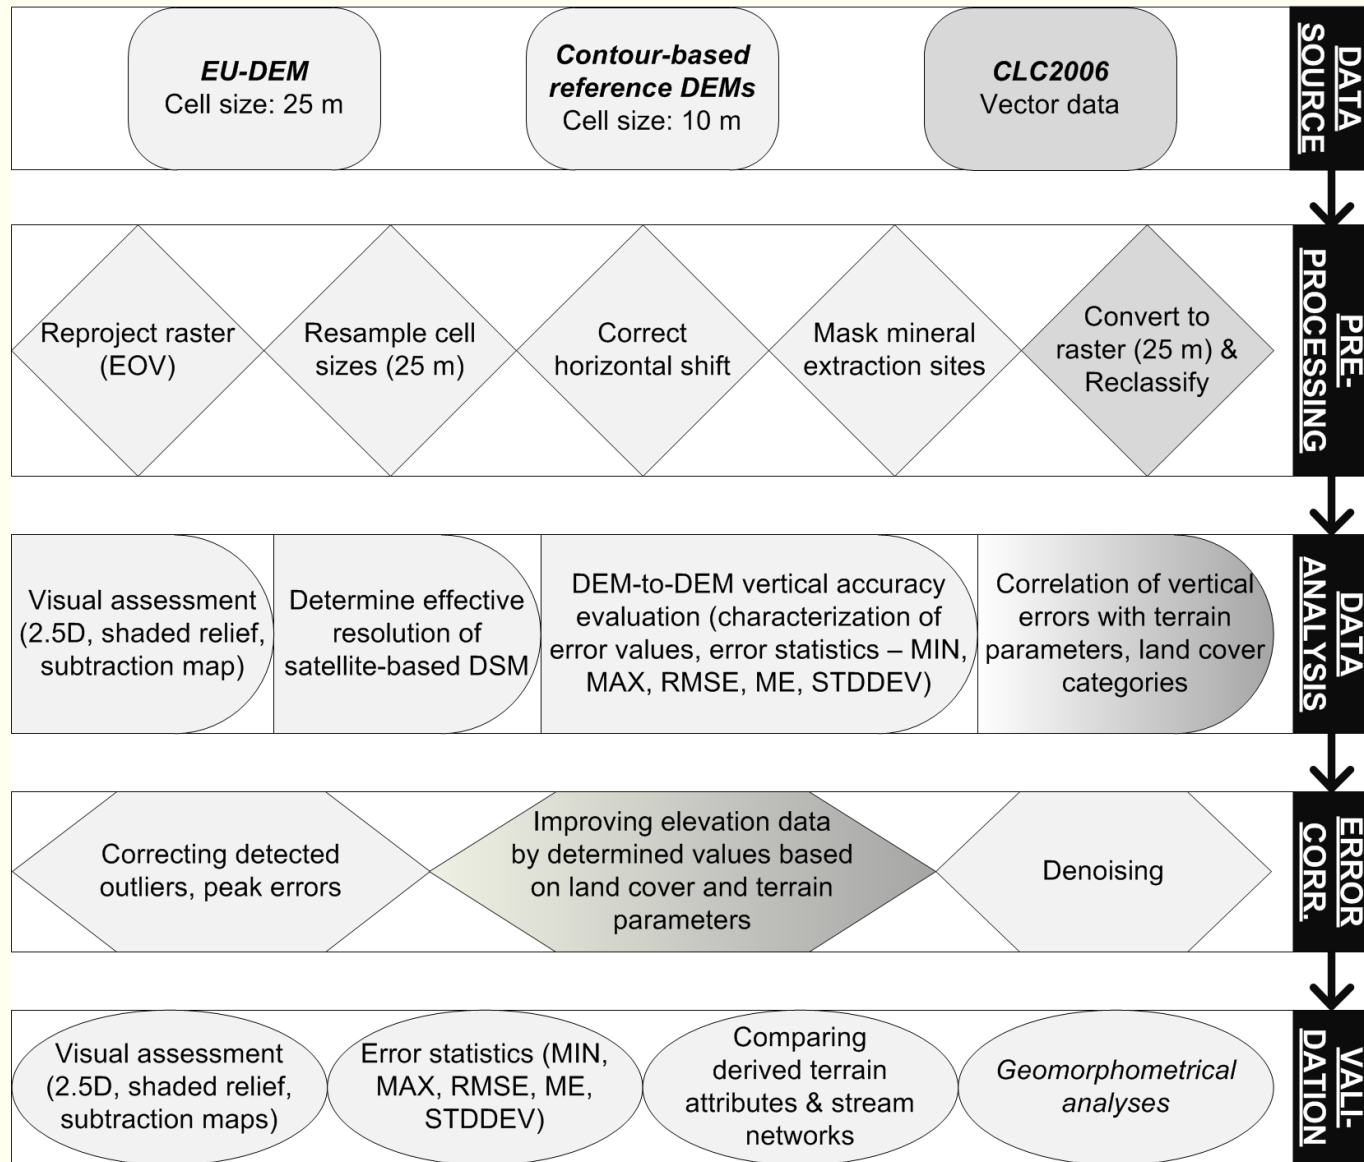

The major goal of the study was to develop a method which allows the user to modify the EU-DEM model in order to make it suitable for geomorphological researches.

The study area

Elevation of the study area
shown on the EU-DEM.

Methods

Research workflow.

Results

0 1,25 5 km

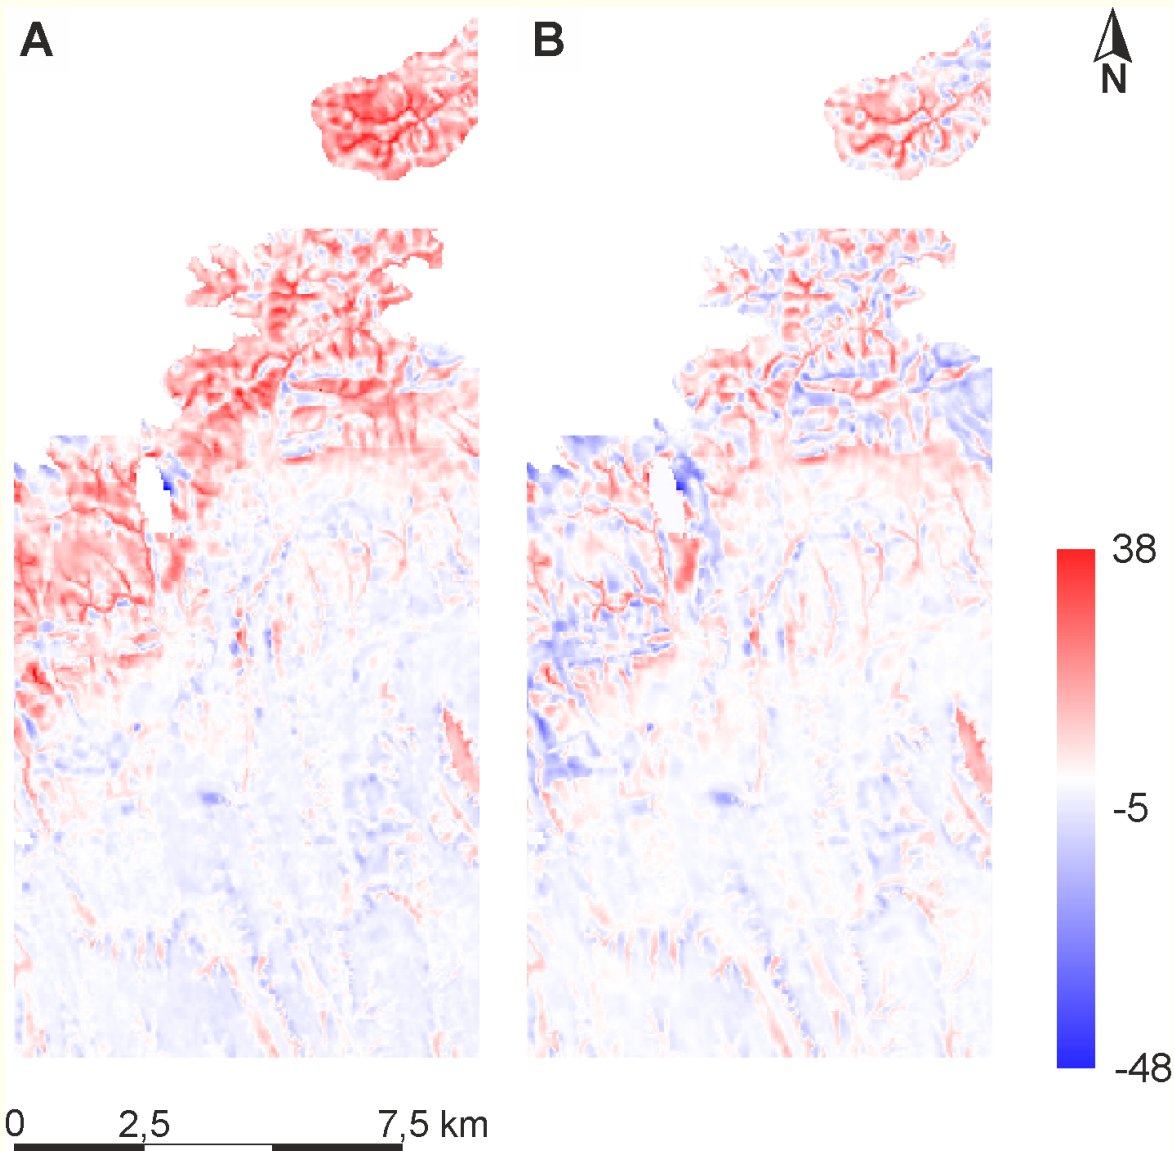

The research area in NVIZ with doubled Z exaggeration.

Results

The working methodology of the denoising method from SUN, X. et al. (2007).
<http://personalpages.manchester.ac.uk/staff/neil.mitchell/mdenoise/>

Results

The subtraction map of the EU-DEM and the reference DEMs before (A) and after corrections (B).

Results

	Original EU-DEM	Outlier correction	LC correction	Denoising, smoothing
<i>Min. elev. (m)</i>	123.4	125.8	126.1	127.1
<i>Max. elev. (m)</i>	677.4	677.4	670.9	667.8
<i>Min. error(m)</i>	-55.4	-48.0	-48.8	-47.5
<i>Max. error (m)</i>	43.3	43.3	36.2	37.9
<i>RMSE (m)</i>	7.6	7.6	5.7	5.7
<i>3σ RMSE (m)</i>	6.4	6.4	5.0	5.0
<i>ME (m)</i>	2.0	2.0	~0.0	~0.0
<i>ESD (m)</i>	7.3	7.3	5.7	5.7

The error statistics of the EU-DEM.

Results

Representation of a geomorphon.

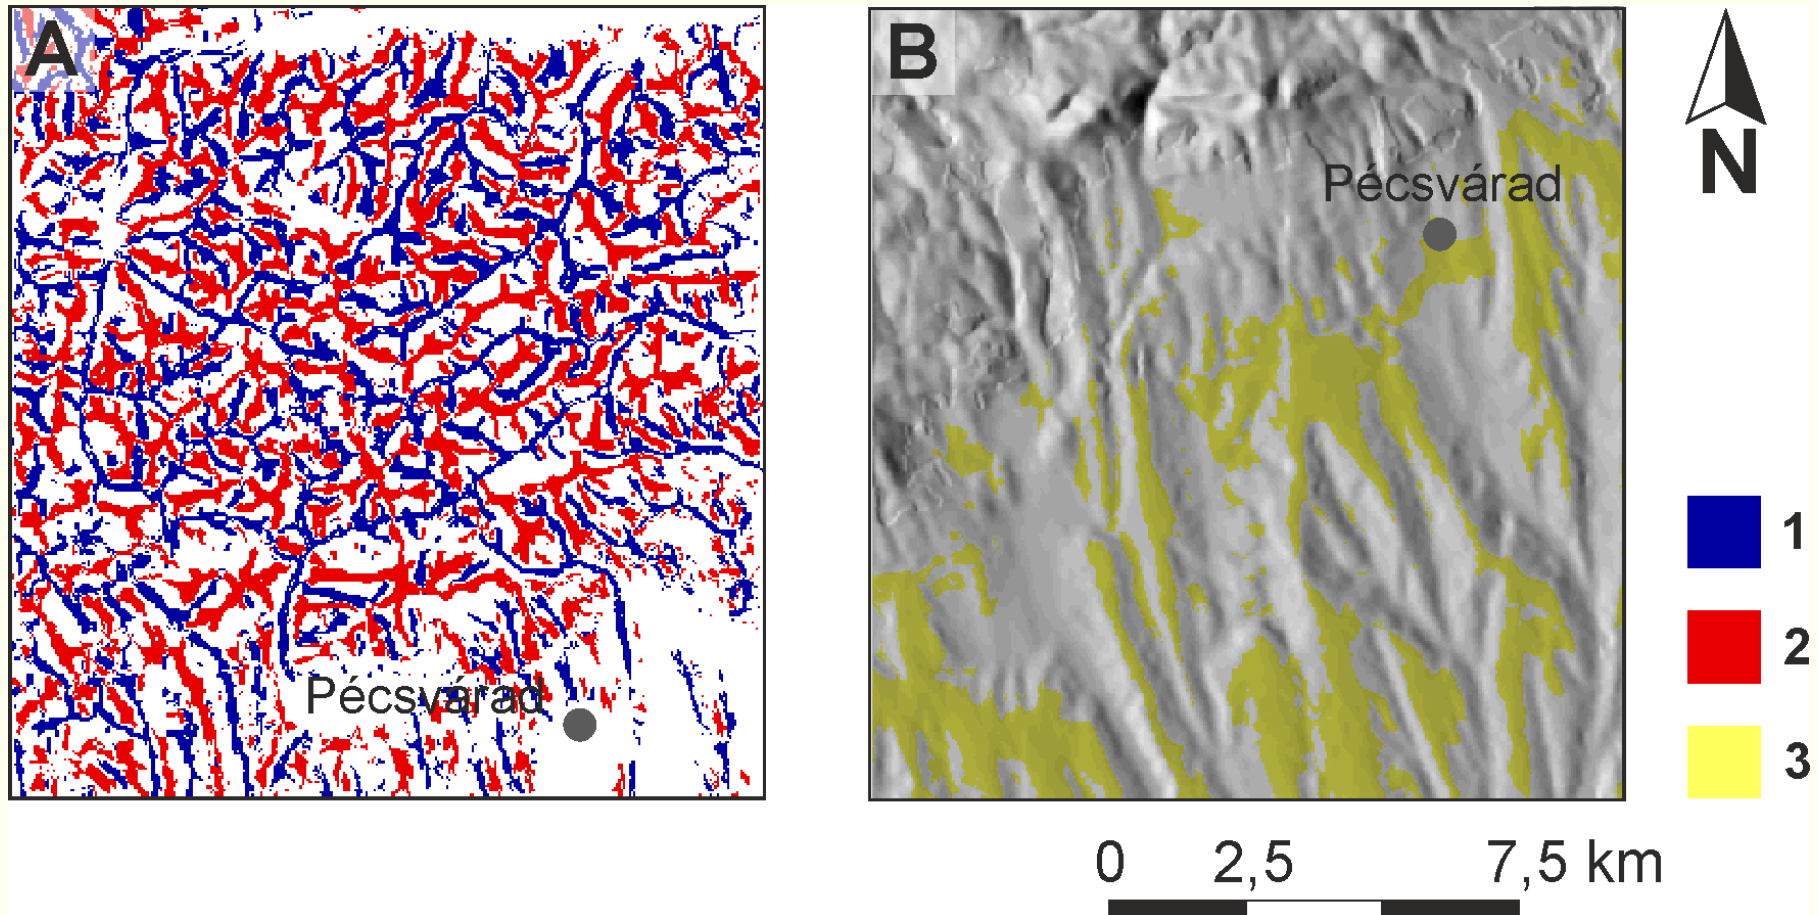

<http://grass.osgeo.org/grass70/manuals/addons/r.geomorphon.html>

Symbolic 3D morphologies and their corresponding geomorphons (ternary patterns) for the 10 most common elements.

Source of figure: Jasiewicz, J. – Stepinski, T. F. 2013

Results

The valley network and ridge lines of the Eastern Mecsek Mountains (A), and the piedmont-like surfaces stretched on the shaded relief map of EU-DEM (B) based on the TPI map. – 1 = valleys; 2 = mountain tops, high ridges; 3 = piedmont like surfaces

Conclusions

<i>Quality assessment of EU-DEM</i>	<i>Geomorphic analyses</i>
<ul style="list-style-type: none"> The elevation errors specific to satellite-based DSMs proved to be present on the EU-DEM. 	<ul style="list-style-type: none"> r.geomorphon add-on proved to be an easy to use, computationally efficient surface analysing tool
<ul style="list-style-type: none"> Correcting the outliers, the erroneous height values caused by the land cover and using the denoising method led to a more accurate model, according to the visual and statistical error assessment. 	<ul style="list-style-type: none"> The selected regions of the southern part appears to be the lower interflaves interpreted as glacia surface remnants between the consequent valleys.
<ul style="list-style-type: none"> The results confirmed the improvement of the model. Setting more precisely the parameters of the correction methods could lead to even more reliable outputs. 	
<ul style="list-style-type: none"> The good match of the generated valley network and analysed landform elements suggest, that despite the remaining errors, the EU-DEM could be a potential height database for geomorphological researches. 	

Thank you for your attention!
